Discuss the four (4) Scrum Events

Scrum is an agile framework for managing and organizing complex projects, consists of four key events that provide structure and facilitate the iterative development process.

The first event is the **sprint planning**, the Scrum team takes responsibility for planning each backlog item, considering their capacity and past performance to determine a realistic amount of work.

The second event is the **daily scrum**, the developers come together in the daily scrum to improve communication and decision-making.

The third event is the **sprint review,** the scrum team showcases actual working results from the user's perspective, avoiding technical details such as lines of code or PowerPoint presentations. It is essential to be organized, start on time, and keep the presentation succinct.

And lastly, the final event is the **retrospective**. the team reviews their performance and identifies areas for improvement. The retrospective is meant for the scrum team, and they decide who should attend. It is important to foster a blameless and complaint-free environment, assuming that everyone did their best under the circumstances.
